REFERENCE NOTES

The 4 or 5 digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a base average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 1.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 1 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 1 to 2 a.m. PST, except for Bishop WB AP which is 10:30 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations, consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

\- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

\- And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

e Thermometers are generally exposed in a shelter located a few feet above sod covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

/ Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Additional information regarding the climate of California may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, 557 Federal Building, 50 Fulton Street, San Francisco 2, California.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CLIMATOLOGICAL DATA

CALIFORNIA

SEPTEMBER 1955
Volume LIX No. 9

ASHEVILLE: 1955

WEATHER SUMMARY

The most noteworthy feature of this month's weather was the continuation of the heat wave which closed August. Almost all of the interior of the State was affected as well as the south coast. Extremely hot weather was experienced during the first week breaking local records of long standing. Above normal temperatures predominated until almost midmonth, but they broke sharply in the north on the 14th as a cold front from a large system whose center had moved into Canada progressed southward over California. The mostly cool second half of the month brought temperature means for the month not too far from seasonal averages with the north and Central Coast Drainages below normal and the warmest division, the Southeast Desert Basins, only a degree and a half above normal, while the most anomalous division, the South Coast Drainage, was barely over two degrees above normal. Drying conditions, particularly in the forested areas of the State, during August and early in September produced a period characterized by the U. S. Forest Service in their CALIFORNIA A-FLAME bulletin as "one of the longest and most critical periods of explosive forest fire conditions in recorded history of the state". The bulletin also states, "the forests and watershed lands of California were subjected to unprecedented losses from 436 wild fires ....59 of which were dry lightning storm set". Details of acreage burned, equipment and men expended in fighting operations, etc. may be found in the bulletin. Early September heat was also responsible for varied crop and livestock losses which will be treated in some detail later in this summary.

Two frontal passages, both associated with the same large scale cyclonic circulation, brought five days of shower activity over the northern third of the State, locally producing substantial amounts of precipitation; over an inch in 24 hours at more than 10 stations and almost two inches at the one with the greatest daily fall. The total fall at the Sacramento City Weather Bureau has been exceeded there during only 5 of the 107 Septembers of record, also they had their first September hailstorm of record. At Strawberry Valley on the 17th the rain and hailstorm deposited 1.97 inches of precipitation and hail to a depth of 1.0 inch causing a five hour power failure and stripping gardens. On the same date a thunderstorm at Lodi with 45 m.p.h. winds produced over an inch of rain in an hour, most of it in about 20 minutes, and some hail. Thunderstorms were also reported in the St. Helena-Monticello-Woodland area and near Berryessa hail was so severe that hunters had to take shelter under their cars. At Red Bluff a 71 day period without precipitation was ended by a 0.01 inch fall on the 13th, followed by 0.25 inch on the 14th and 0.85 inch on the 16th. The average monthly total for the three northern divisions came to over half again the normal. Activity decreased southward, however, and the two central divisions averaged only about a quarter of their normal total while the two southermost divisions did not have enough measurable rain to make computation of a numeric average possible. Over 300 stations went through the month without measurable precipitation while only 2, on the extreme north coast, had over three inches. Where precipitation occurred it was beneficial for relieving the forest fire situation and greening ranges and pastures and did not appreciably interfere with harvesting operations, although it did some damage to cut alfalfa and seed crops of clover and Sudan grass.

Numerous temperature records were undoubtedly broken during the heat spell. Some of the more important ones, mostly recorded at stations maintaining complete comparative data from which record data is readily available, are given below. More detailed information can be found in the Local Climatological Data publications of the stations concerned. At Bakersfield a new September highest was established at 112° on the 12th. For Blue Canyon 93° on the 4th was record-equaling for this month. The 111° maximum recorded at Burbank on both the 5th and 6th is a new highest for September as well as equal to the all-time highest first established on August 26, 1944. Records for persistence of hot days were also set at Burbank by eight days 100° or above ending with September 7, and 20 days of 90° or above ending with September 14. At Fresno a September highest record which had stood since 1888 was equaled on the 3d with a 111° reading. At the Los Angeles Airport exposure the 108° maximum on the 1st became the new absolute highest, being 4° higher than the previous top reading. The monthly mean at this point provided the second warmest September of record, only 0.2° below the record mean. The city observatory also had a second warmest September on an average basis as well as a new absolute highest temperature of 110° on the 1st. Mt. Shasta's new all time high of 103° was recorded on the 2d and the following two days were the warmest there for so late in the season. The Sacramento City high of 109° on the 2d was highest there for the date and so late in the season but was only equal to the September highest and was 5° below their all time highest, a July reading. The San Bernardino record for consecutive days with 100° or higher covering the period since 1898 was equaled on the 8th of the month followed by 6 more such days to make a new record of 20 days. The Bay Area was missed by the record breaking heat, this month being the eleventh one with below normal temperature and the coolest September since 1910 at the San Francisco Federal Office Building exposure.

Weather effects to agriculture, mostly gleaned from publications of the California Crop and Livestock Reporting Service and the California Weekly Weather and Crop Bulletin, follow: CENTRAL COASTAL AREA: High temperatures early in the month were favorable for ripening late fruits, particularly prunes; but caused considerable sunburn to grapes, walnuts, and tomatoes. Rains around midmonth were helpful to crops, ranges, and forests but damaged some alfalfa hay and dampened prunes and almonds while the cool weather following did not favor crop development, and drying winds hurt pastures and required heavy irrigation where available. SACRAMENTO VALLEY: Hot weather through the first two weeks of the month was favorable for rapid maturation of all crops but it was conducive to pest development requiring spraying in orchards and, together with low relative humidities, had a drying effect on pastures and ranges and caused some sunburn damage which persisted in the lower valley into the third week. Rains during the third week and subsequent cool weather damaged some hay and locally held up harvesting activities. Pastures and ranges were improved and some new growth noted. SAN JOAQUIN VALLEY: Cotton and grapes were favored by the early hot spell and good drying conditions for raisins prevailed through the month. SOUTH COAST AREA: These districts were the worst hit by the heat. Sunscald of foliage occurred on new growth of nearly all vegetables. Considerable root crops were burned, also citrus and avocado trees as well as fruit. Crop losses were estimated to approach $5 million. Low relative humidities also were a factor in critical fire danger and fires contributed to agricultural losses. Heavy irrigation produced acute water shortages and completely emptied some reservoirs. Losses in poultry and rabbits was estimated at $4 million. The heat was beneficial in maturing the portion of the crops it did not burn, and cooler weather toward the end of the month allowed vegetation in general to recover and harvesting operations to progress under seasonable conditions.

Harry E. Torbitt

REFERENCE NOTES

The last digit (identification number) in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:00 a.m., PST, Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

\# Thermometers are generally exposed in a shelter located a few feet above sod-covered ground, however the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

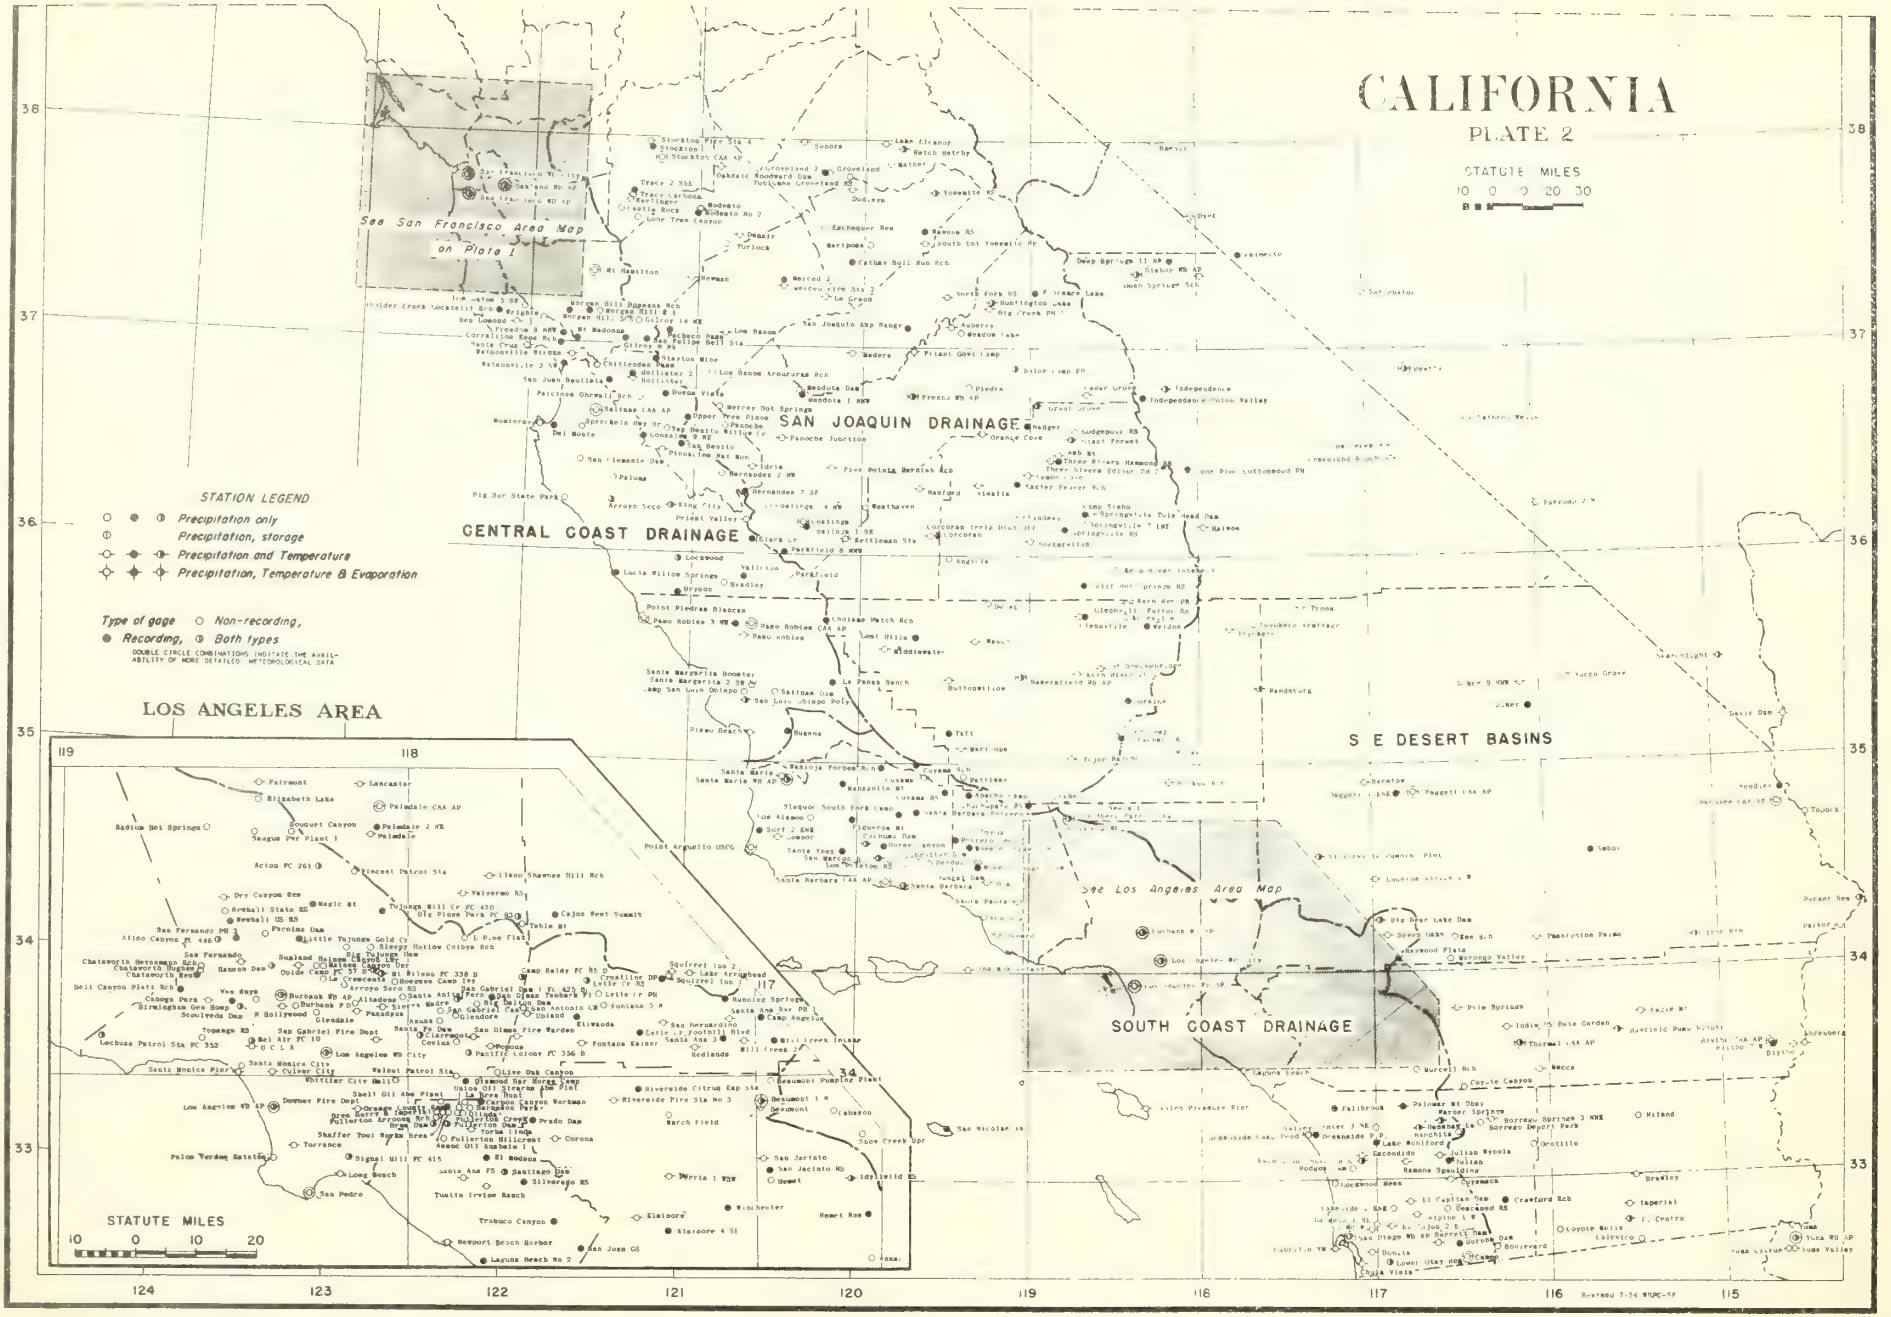
R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.



VAR This entry in time of observation column in Station Index means variable.

Additional information regarding the climate of California may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, 557 Federal Building, 50 Fulton Street, San Francisco 2, California.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

OCTOBER 1955
Volume LIX No. 10

ASHEVILLE: 1955

WEATHER SUMMARY

Over the State temperatures averaged a little more than a degree above the October normal and precipitation approximately a quarter of the usual average total. Within the past three years there have been both warmer and cooler as well as wetter and drier Octobers. The effect of weather on agriculture was not unusual for this time of year, with local losses at times to susceptible vegetation but overall the season progressed as usual. Fire danger in forests had quieted down to near normal by the beginning of the month, following a very high incidence in September. There was another increase in danger this month, however, and all areas were considered above normal by the end of the month, with the extreme southern portion critical. Numerous small fires were started during Santa Ana wind conditions but no large scale losses occurred. An earthquake on October 23 was felt throughout the Bay Area, as far north as Santa Rosa, south to Ben Lowman, and east to Yosemite National Park. Some damage to window and display glass occurred, and considerable stock was tumbled from shelves, breaking containers of liquids of some value, in and near Walnut Creek.

With the exception of the South Coast Drainage which was about a half a degree below normal, all divisions of the State showed above normal temperature averages ranging from very close to normal for the other two coastal drainages to nearly 2° above normal for the two interior drainages and the Southeast Desert Basins Division, and over 2° for the Northeast Interior Basin Division. Near the coast in the North Coast Drainage individual stations showed negative anomalies and near the mountains in the Los Angeles area of the South Coast Drainage appeared large positive anomalies, otherwise local deviations from the divisional pattern were small. Daily temperatures were well above normal in interior valleys from the 12th through the 17th, locally occasionally more than 10° above normal, and again around the 24th and 29th. They were farthest below normal, but not outstandingly so, on a variety of dates, the 10th predominating in the north. Extremes in temperature showed the usual range. The highest average monthly value was 81.4° at Cow Creek and the highest maximum reading 108°, recorded at Brawley on the 2d and 3d, at Indio U. S. Date Garden on the 3d, and at El Centro on the 9th. Lowest average was 33.8° for White Mountain Number 2 and lowest minimum 9° at White Mountain Number 1 on the 26th.

The only significant precipitation in the State occurred over the three northern divisions, and even in the one of these with the heaviest falls, the North Coast Drainage, less than half the normal average was received. Station totals over half normal amounts appeared in the northwest corner of the State and along the coast north of San Francisco, also in the southeast portion of the Sacramento Drainage. The greatest monthly total was 7.66 inches at Crescent City, one of the two stations receiving an above normal amount. The greatest daily fall occurred at the Crescent City 7 ENE site with a 4.25-inch measurement on the 10th. The bulk of rainfall occurrences fell on that day and near the 19th and the 26th. There were 222 stations without precipitation during October. At Bakersfield the end of the month marked the 176th consecutive day without measurable precipitation.

Publications of the California Crop and Livestock Reporting Service, issues of the California Weekly Weather and Crop Bulletin, summaries made by the Red Bluff and Sacramento Weather Bureau Offices, and cooperative observers notes indicate the following effects of weather on agriculture: In general the weather was favorable for harvesting operations although they were slowed some locally by rains and occasionally by the threat of rain. There was local mould of canning tomatoes and damage to honeydew melons from the rains in the north. Moisture was on the whole inadequate, however, and range feed was below average although varying widely with a scarcity apparent in some areas and some stock water shortages reported. There was some slight loss of hay during the brief rainy periods but rapid drying thereafter held this to a minimum. Almost completely dry weather in southern areas was particularly beneficial for cotton development and favored raisin processing although these areas could have benefited from more dew for dusting operations. Periods of warm weather, while favoring growth, also brought on more trouble with pests, particularly aphids and red spiders. Cool periods retarded development of late crops including citrus growth and were not helpful for sugaring grapes. The most notable temperature effect came from hot weather previous to October, however, as lower quality was showing in fruit and nuts from September burn. Frost at the end of the month nipped some grape vine tips and started the end of tomato harvesting in the Sacramento Valley, but freezing did not become general until the following day or so and a more detailed account of freezing will be found in the November summary. There were no severe damaging storms or floods.

Harry E. Torbitt

REFERENCE NOTES

[illegible]

Figures and letters following the station name [illegible]

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this [illegible]

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind [illegible]

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for [illegible]

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. [illegible] ground values are at 4:30 a.m., PST, except for Bishop WB AP [illegible] 10:30 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent [illegible]

Water equivalent samples, as published in Table 7 are necessarily taken from different points [illegible] in the snowpack result in apparent inconsistencies in the record.

No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

• Amounts included in following measurement, time distribution unknown.

Thermometer [illegible] covered [illegible] roof of a building.

Gage [illegible]

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are [illegible] itation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent [illegible]

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December [illegible]

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Additional information regarding the climate of California may be obtained by writing to any Weather Bureau Office [illegible] Weather Bureau Office, 557 Federal Building, 50 Fulton Street, San Francisco 2, California.

Subscription Price: 20 cents per copy, monthly and annual, $2.50 per year. (Yearly subscription includes [illegible] Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CALIFORNIA

NOVEMBER 1955
Volume LIX No. 11

ASHEVILLE: 1956

WEATHER SUMMARY

The month averaged a little below normal (less than two degrees) in temperature and was marked by locally damaging freezing in the north at the beginning and later in the month farther south. Precipitation averaged only slightly more than normal for the State as a whole, but for some areas this was the first significant rainfall of the season. Although comparative average figures are not available this was undoubtedly one of the snowier Novembers in California. While monthly wind movement appeared to be about average there were some high winds reported, locally of damaging proportions.

With the exception of the Northeast Interior Basins Division which averaged barely a fraction of a degree below normal, all divisions of the State averaged over a degree below their normal temperature values for November, with the San Joaquin Drainage Division, the most anomalous one, going two degrees below its long-term mean. In general the interior valley areas were the farthest below normal on the average, while the eastern desert regions had the only above normal station averages. Station monthly means ranged from 64.0°, recorded at Brawley, to 24.2° for White Mountain 2. The cold weather which closed October carried over into this month for the first day or two followed by rising temperatures which reached more than 10° above normal values locally from the 7th through the 10th. Temperatures broke sharply on the 11th and, except for brief warming on the 19th, continued sub-normal through the 25th followed by variable but mostly near normal temperatures the remainder of the month. Some records were broken at individual stations during the month, in both highest and lowest classes, mostly for specific dates or for so early in the season. At the San Francisco city observatory the 84° maximum registered on the 8th established a new November highest, however, and Sacramento's 83° maximum on the following day was within a degree of tying the November high there. Also the State low of -13° recorded at Mt. Hebron on the 15th was, along with a like reading in 1935, second lowest of record, after a -18° minimum in 1915. The State highest of 95° recorded at Indio U. S. Date Garden on the 8th has been exceeded in a number of previous years.

Precipitation averaged very near normal for the State as a whole with only a slight positive anomaly. All climatological divisions, except the Southeast Desert Basins Division which received only about half its small normal amount, also had fairly near normal averages ranging from about 90 percent of normal in the Central Coast Drainage to about 115 percent for the North Coast Drainage. There was considerable variation within the divisions, however, with a large area in the northern portion of the North Coast and Sacramento Drainages and another in the southeastern part of the San Joaquin Drainage showing over 150 percent of normal while most of the eastern half of the Southeast Desert Basins Division went through the month without measurable precipitation. The first snowfall of the season came exceptionally early and was undoubtedly locally unprecedented for amount in November. A good portion of northern intermediate and high level stations had significant amounts and a number of high level stations had totals of over 20 inches, also a few in Butte, Nevada, Placer, and Yuba Counties over 40 inches. There were even some fair falls in the mountains east of Los Angeles and as far south as the Palomar Mountain Observatory. The greatest total in the State was 70.0 inches at Twin Lakes, while Mt. Shasta's 26.2-inch total set a new all-time November record dating back to 1890 and the 1.9 inches at Red Bluff was the first snow ever recorded there in November since 1877.

On a day to day basis there was little precipitation until around the 5th when it occurred at a majority of stations in the three northern divisions. Then mostly dry weather prevailed until the 13th and 14th when a general storm predominated over almost the entire State, slacking off a bit on the 15th but followed by general precipitation again on the 16th and 17th. The two northwestern divisions continued raining for the most part through the 26th, and the other northern, central, and southern coastal divisions through the 18th, around the 21st, and the 23d. Most noteworthy of these periods was the one beginning on the 13th. Since this storm approached "severe storm" proportions, an account prepared by the State Climatologist at San Francisco will be found under separate heading at the end of this summary. The extent of other storm activity is reflected by the following reports from cooperative stations: Perris on the 7th, dust and windstorm. Kaiser Fontana, 7th and 8th Santa Ana winds to 61 m.p.h. maximum. Kettleman Station, brisk wind and sandstorm on the 11th. Elk Valley on 19th, high winds, limbs in road. In some areas a prolonged dry spell was broken by November precipitation, particularly at Bakersfield a drought of 196 days duration was broken by the rain of the 13th. At Eureka heavy rains of the 19th and 20th caused all rivers to rise sharply but no floods occurred.

Weather during November had the usual varied effects on agriculture in California. In general the rains were much needed for improving pasture and range conditions and for subsoil moisture but held up final harvesting operations -- enough to finish the season for some crops. In the wetter sections fields continued too wet to work even during the dry periods while in the drier southern sectors there was still insufficient moisture for proper seedbed preparation. Cold weather caused variable (for some produce, particularly tomatoes, grapes, and peppers considerable) losses to tender vegetables in all but the southermost areas but was beneficial for fruit coloring in citrus districts. Snow halted growth temporarily in upland ranges and was bothersome to transportation locally but otherwise had little economic significance.

Harry E. Torbitt

WIND, SNOW, AND RAINSTORM OF NOVEMBER 11 - 14

A storm center moved rapidly southeastward from the Gulf of Alaska to northern California on the 13th and eastward across the State with the storm front trailing southeastward across southern California on the 14th. This storm caused the first substantial precipitation of the season in most of the State, much below normal temperatures, high winds in northern and central California, and early heavy snows in the Sierra. Winds and precipitation from this storm caused some property damage but the value of the heavy precipitation as a water resource far outweighed the destructive effects, precipitation in all areas of the State having been well below the seasonal normals prior to the 13th. Winds reached a fastest mile of 44 m.p.h. at Sacramento and 35 m.p.h. at San Francisco International Airport breaking tree limbs and power lines in Sacramento and the San Francisco Bay area. Other parts of the State also received locally damaging winds: Llano Shawnee Hills Ranch in Los Angeles County was without power for over eight hours due to wind, also Placerville in Eldorado County reported small wind damage and Randsburg in Kern County reported TV aerials blown down and cars sand-blasted. The rain also backed up sewers and caused local flooding of streets in San Francisco and San Rafael. In San Pablo Bay winds and waves swamped boats and tore apart duck blinds stranding several duck hunters, and small craft and barges were set adrift by the gusts. More than a foot of snow fell at Donner Pass delaying traffic and necessitating the use of chains. Snow mantled Mount St. Helena closing the Calistoga-Middletown highway for several hours, and snow was also reported in the Clear Lake area and on Mount Hamilton. At Los Angeles 0.85 inch of rain was measured on the 13th and 14th; 14 inches of snow was reported on peaks above Mt. Baldy Village with snow reported down to the 4,000-foot level. At Big Bear high winds felled trees and interrupted telephone service. Highway 399 was closed by snow from western Kern County through the Cuyama Valley to Ventura. Wind-whipped waves swamped the 82-foot purse seiner New Saturnia off Laguna Beach.

Robert F. Dale

REFERENCE NOTES

The four-digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

\- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

\# Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

E Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Additional information regarding the climate of California may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, 557 Federal Building, 50 Fulton Street, San Francisco 2, California.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CALIFORNIA

DECEMBER 1955
Volume LIX No. 12

ASHEVILLE: 1956

WEATHER SUMMARY

The outstanding feature of the month was the record breaking precipitation totals producing unheard-of flood damage in many localities. An account of flood damage has been prepared by the State Climatologist at San Francisco and will be found under separate heading at the end of this summary. The average total precipitation for the month was 6.32 inches above normal, the highest on record. This occurred despite the fact that southern California had below normal rainfall. A line dividing the above and below normal precipitation can be drawn starting with Oxnard north-northeastward through Tehachapi and Lone Pine and thence northeastward to the Nevada border. A fairly stationary high pressure area dominated the southern part of the State so that a continuous series of weather fronts, originating in the vicinity of the Hawaiian Islands, moved northeastward over this High and dumped a tremendous amount of precipitation over central and northern California. Because this moist air had its origin in a warm region, the snow-level was considerably higher than usual, up to 10,000 feet at times. This resulted in the melting away of the above normal snowpack from November, and the combination of melting snow and heavy rains raised streams and rivers to record breaking heights. The heaviest of the rains occurred between the 17th and 24th and again on the 26th. Damaging winds accompanied these storms. In southern California strong winds were evident mainly as a result of the only major weather frontal passage on the 1st and 2d. Although only light rains fell in southern California, more than average cloudiness and fog occurred in the Los Angeles Basin and along the coastal regions to San Diego.

December temperatures averaged 1.9° above normal, so that with the exception of November, every month since August has been above normal. The highest mean of 57.9° was recorded at Imperial; the lowest of 23.0° at White Mountain 1. Of the seven divisions in the State, only the South Coast Drainage was below normal, and that was only -0.2°. Day to day temperatures show that most of the State was cooler than normal during the first six days, but except for southern California coastal areas between the 15th and 19th, the remainder of the State showed a warming trend with mean temperatures of 5° to 15° above normal between the 8th and 26th. Borrego Springs 3 NNE reported the maximum temperature for the month of 89° on the 20th. Temperatures fell again during the last five days of the month in all divisions with White Mountain 1 having the monthly minimum of -16° on the 28th. The San Francisco City Office had a mean temperature above normal for the first time since October 1954. Bakersfield's minimum of 63° on the 23d was the highest they ever had in December. Light local frosts were reported in the southern part of the State generally during the last few days of the month.

The greatest monthly precipitation for the State was 54.08 inches at Strawberry Valley. In fact, precipitation records of all kinds for the month were broken. Some examples are: Fresno and Mt. Shasta had the greatest December amounts in their recorded history; it was Sacramento's wettest December since 1867, and San Francisco's since 1889; Sacramento had 19 days of measurable rain with one inch or more on five of those days; San Francisco had 22 days of measurable rain; Blue Canyon reported 36.37 inches of precipitation above normal for the month and was already 0.98 inch above its seasonal normal. This station also had 24 days of measurable precipitation making the monthly total 45.12 inches. For the State, the maximum daily amount was 15.34 inches at Lakeshore. The storage gage station at Cold Springs Camp reported that 40.00 inches of precipitation fell between the 15th of December and the 3d of January. Percentagewise, the North Coast Drainage had 247 percent of normal, the Sacramento Drainage 327 percent, the Northeast Interior Basin 498 percent, the Central Coast Drainage 319 percent, and the San Joaquin Drainage 371 percent. In contrast, in southern California the South Coast Drainage received 54 percent of normal and the Southeast Desert Basins 41 percent.

There were several reports of loss of livestock and soil erosion near the streams from December's floods, but damage to crops had been reported from only limited areas. In the northern California valleys harvesting of strawberry plants was delayed as was the planting of alfalfa because of the very wet ground. In the upper Sacramento Valley the rain delayed leaf curl spraying in peaches, pruning, and preliminary frost protection measures in almond orchards. There was little agricultural land reported damaged by floods. In fact, the warm rains actually accelerated the growth of range grasses. The lower Sacramento Valley and Tulare County were badly hit by floods so that the problem in many orchards became one of drainage rather than pruning. The wet land also delayed most truck crop operations in these areas. The extensive rains forced some feeder lambs to be moved temporarily from normal pastures. In the Los Angeles area the cool days were unfavorable for maturing Navel oranges which were coloring and sizing, but the sugar content was insufficient for picking except in the Redlands district. Rangelands and grain were growing well, but adequate rain was needed. The lack of moisture was becoming an even more serious problem in San Diego rangelands. Livestock in southern California was in good condition with irrigated pasture conditions being exceptionally good.

Joseph R. Glantz

SEVERE WINDS, RAIN, AND FLOODS OF DECEMBER 18 - 26, 1955

A series of weak storms moving east-northeastward into the State from the 15th to the 18th caused light rain in northern California on the 15th spreading to most of central California by the 18th when an intense Low in the Gulf of Alaska moved southeastward, strengthening the southwesterly flow of warm moist air from the Pacific and the series of storm fronts moving eastward over the State. This general situation, an intense Low in the Gulf of Alaska-North Pacific area with high pressure extending in an arc from the Aleutian Chain over Alaska into Canada, and a procession of storms moving from the west-southwest into the State, continued through the 26th when the High near the Aleutians moved eastward causing northerly flow of cooler air over the State behind the last storm front of the series and bringing a welcome end to the heavy continuous rains. Record precipitation totals occurred at many stations in central and northern California in the storm period which, in conjunction with the much above normal temperatures causing melting of the snowpack to high elevations, resulted in the worst flooding of record in most areas. A complete explanation of the meteorological causes of the storm will be carried in the December 1955 Monthly Weather Review, and because the storm precipitation was unusually heavy, persistent, and widespread, a supplementary table of daily precipitation amounts has been included in this bulletin for many unofficial precipitation stations for which rainfall data are not published in Table 3. A glance at the tabular daily amounts in the period from the 18th through the 26th is self-explanatory in showing the magnitude of the storm. Precipitation data from unofficial stations received too late to be included in this bulletin will be published in the June 1956 CD, California.

The first heavy rain and gale winds of the storm occurred on the 18th as far south as Merced and Salinas. On the evening of the 18th winds reached a peak gust of 63 m.p.h. at the San Francisco Airport, and fastest miles of 52 m.p.h. at Sacramento and 39 m.p.h. at Red Bluff. The high winds and heavy rain continued on the 19th causing extensive damage to buildings, trees, and power lines. The greatest wind damage was experienced in the San Francisco and Sacramento areas in this first windstorm of the series, but high winds occurring locally throughout the storm period, generally peaking again on the 22d - 23d and on the 26th, caused extensive damage. Damage to insured property by wind, aggravated by the continuous rains, in northern and central California was estimated by the General Adjustment Bureau at $2,750,000. High winds were also reported in the Owens Valley on the 23d where several power poles were blown over and roofs damaged.

Rivers, swollen by the heavy rains and melting snow, rose to record heights in northern and central California in the period from the 21st through the 24th with the resulting floods dwarfing the wind damages caused earlier in the storm. Probably the first severe flooding occurred in the north coastal areas where rivers almost submerged and destroyed whole towns. Bridges, roads, railroads, and communication lines were severely damaged and the only outside contact with many localities was by radio. Geological Survey measurements showed the Klamath River near Klamath rose to a maximum height of 49.7 feet at 1:30 p.m. on the 22d, six feet higher than the previous maximum on January 18, 1953; the observer at Klamath reported the town 95 percent destroyed. The Eel River at Scotia reached a high of 61.9 feet at 4:00 p.m. on the 22d, almost seven feet above the previous high reached on December 11, 1937. Guerneville was flooded when the Russian River reached 39.15 feet the forenoon of the 20th and again at 3:00 p.m. on the 23d when it reached 49.7 feet, compared to a previous maximum height of 46.87 feet on February 28,1940,and a flood stage of 29 feet. In the Central Coast Drainage San Francisquito Creek at Stanford University flooded a portion of Palo Alto when it reached a high of 13.6 feet at 12:00 p.m. on the 22d, more than three feet above the previous high reached on November 18, 1950. Pescadero Creek near Pescadero went out of its banks on the 22d flooding the town and reaching a height of 21.27 feet at 2:00 a.m. on the 23d in comparison with the previous flood maximum of 15.61 feet on December 7, 1952. The San Lorenzo River rose to 22.55 feet at Big Trees at 1:30 a.m. on the 23d surpassing the

previous high of 21.1 feet reached on February 27, 1940; downtown Santa Cruz was flooded with 4 - 5 feet of water. The Pajaro River near Chittenden reached a height of 32.46 feet at 9:00 a.m. on the 24th with the previous maximum height 26.2 feet recorded on April 4, 1941; Watsonville was not flooded but another nine inches would have put five feet of water in much of the city. Flooding occurred on the 24th through the 26th near the mouths of foothill creeks at the base of the Santa Ynez Mountains between the city of Santa Barbara and Gaviota Pass but damage was largely confined to highways blocked by slides, and several homes flooded by overflow of creek banks.

In the Sacramento River Forecast District the Meteorologist in Charge summarized the major flooding as follows: "Flooding of the bypass systems of the Sacramento was our first concern at the onset of the storm but the inflow below Shasta Dam into the Sacramento River and into the Feather and Yuba Rivers was so great that the bypasses were soon filled to capacity. The major flooding in the Sacramento Valley outside the bypasses occurred mostly in three areas: (1) At a levee break on the Feather River just below Nicolaus at 12:10 p.m. on the 23d that flooded the very large Reclamation District 1001 and the town of Nicolaus. Although the river dropped below the established danger stage about the 24th, Reclamation District 1001 and Nicolaus remained flooded through the end of the month. (2) Near the confluence of the Bear and Feather Rivers, and to the north of the Bear River where a very large area of lowland was flooded, mostly due to backwater from the Feather. (3) At a levee break just below Yuba City (Gum Tree station) where approximately 3,000 feet of levee gave way suddenly, resulting in widespread flooding, destruction of homes and orchards and loss of life. At the time of the levee break, a few minutes after midnight on the 24th, the stage reading at Marysville was six feet above the previous high stage reading of 76.2 feet established in 1937. The Feather and Yuba Rivers rose again in the period from the 26th through the 28th, and, although the crest was below the danger stage, Yuba City was reflooded through the levee break.

"In the lower San Joaquin Valley major flooding occurred in the following areas: (1) Near the confluence of the Cosumnes and Mokelumne Rivers, between Franklin and Bensons Ferry, where a large area of agricultural land and some homes were flooded. The spill over Pardee Reservoir into the Mokelumne was the greatest ever recorded andthe crest at Bensons Ferry was 1-1/2 feet above the previous maximum recorded crest. (2) The northeastern part of Stockton was flooded, mostly because of inadequate drainage capacity of Mormon Slough and Calaveras River. The development of land adjacent to the slough had eliminated many of the natural drainage facilities. (3) Over the lowlands adjacent to the mouth of the Stanislaus River and to some extent adjacent to the mouth of the Tuolumne River. (4) In the delta region where a combination of high tides, gusty winds at times, and the heavy inflow created an extremely dangerous situation for approximately one week. Four major island tracts were completely flooded and several others partially flooded.

"As an interesting sidelight, the water master for Don Pedro Reservoir, on the Tuolumne, stated that calculations of the historic flood of 1862 indicate that the peak mean daily flow on the Tuolumne was 77,000 c.f.s. This month the peak mean daily flow into Don Pedro was 83,000 c.f.s., despite the fact that the upstream reservoirs at Hetch Hetchy, Lake Eleanor, and Cherry Valley were still filling at the time."

The Meteorologist in Charge of the Fresno River District furnished the following report for the upper San Joaquin Valley: "Flooding occurred in the Fresno River District December 23d - 26th, 1955 in all rivers, streams and creeks rising in the Sierra Nevada Mountains from the Merced River in the north to the Tule River in the south. Some of the highest stream flows in the history of the rivers occurred with peak flows and total runoff exceeding the heavy floods of 1950. In general the peak flows in the big flood of 1950 were momentary, whereas in the current flood high flows were recorded over a longer period.

"The Kaweah and St. Johns Rivers, east of Visalia, broke weirs and levee systems, washed out bridges and roads and created a river 'one thousand feet wider than I have ever seen it' in the words of Mr. Holly, the water master for the river district. These rivers flooded parts of Visalia to a depth of four feet and formed a lake 10 to 15 miles long to the east of the city.

"Smaller streams and creeks flowing out of the foothills flooded lowland areas, overflowing irrigation systems, breaking levees and undercutting roads, while storm drains in cities and towns failed to cope with the rainfall and caused additional local flooding. The Chowchilla River and Berenda and Ash Sloughs overflowed into lowlands of Chowchilla, flooding U. S. Highway 99 and its adjacent business district to a depth of 4 to 5 feet, stalling many cars and several large buses. Black Rascal Creek overflowed its banks flooding the northeast part of Merced, and other towns reported high water. Considerable agricultural land was inundated with little damage to the land, but some unpicked cotton was destroyed and livestock was lost; 800 pigs were lost near Madera and many cattle were isolated, requiring supplementary feeding by air-drop."

A Preliminary special storm and flood report by the American Red Cross summarizing the loss of life and damage in California from the December storm is given in the following table:

NUMBER

A comprehensive report of the California floods of December 1955 has been published by the California State Division of Water Resources. A final storm summary of the "Western States Floods of 1955" will be published by the American Red Cross about April 1, 1956. A complete report of the "Floods of December 1955 and January 1956 in Western States" is now in preparation by the U. S. Geological Survey and will be published later this year.

It will be some time before a monetary value can be placed on the December storm damage but it is expected to be well above 100 million dollars. Cost of operation to the American Red Cross will be in excess of $8,000,000 for assistance to over 11,000 families, and damage to highways and roads alone was estimated at $31,416,000 by the Assistant State Highway Engineer.

Robert F. Dale

CORRECTED DATA

JULY 1954	ROCK CREEK	PRECIPITATION MEASURED IN STORAGE GAGES TABLE, Page 171: Observation date October 19, 1954, should be October 18, 1954.
	SANTA YNEZ	PRECIPITATION MEASURED IN STORAGE GAGES TABLE, Page 171: Delete entire record published after November 23, 1953.
JUNE 1955	DOWNEY FIRE DEPT	TABLE 3: Precipitation on 11th should be .01 and monthly total .01.
	HOBERGS	TABLE 3, DELAYED DATA, MAY 1955: Precipitation on 1st should be trace and monthly total trace.
JULY 1955	CHICO EXP STATION	TABLE 6: Wind movement on 31st should be 39 and monthly total 1022.
	WALNUT GROVE	TABLE 6: Evaporation on 31st should be .38 and monthly total 11.13.
SEPTEMBER 1955	WINTERS	TABLE 3: Precipitation on 14th should be .03 and monthly total 1.07.
NOVEMBER 1955	BOWMAN DAM	TABLES 2 and 3: Precipitation on 16th and 17th should be accumulated (*) amount of 1.76, monthly total 7.20, and departure -.47.
	CALLAHAN RS	TABLES 2 and 5: Min temperature on 19th should be 42°, mean min 28.3°, mean 41.1°, and total degree days 711.

THIS ISSUE CONTAINS ADDITIONAL PRECIPITATION DATA FOR THE STORM OF DECEMBER 16 - 27, 1955 ON PAGES 342 THROUGH 346.

REFERENCE NOTES

The four-digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65°F.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Sleet and hail were included in snowfall averages in Table 1, beginning January 1949.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 10:30 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

\+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

\# Thermometers are generally exposed in a shelter located a few feet above sod-covered ground, however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are published later in Hourly Precipitation Data.

D Water equivalent of snowfall wholly or partly estimated, using a ratio of 1 inch water equivalent to every 10 inches of new snowfall.

M One or more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

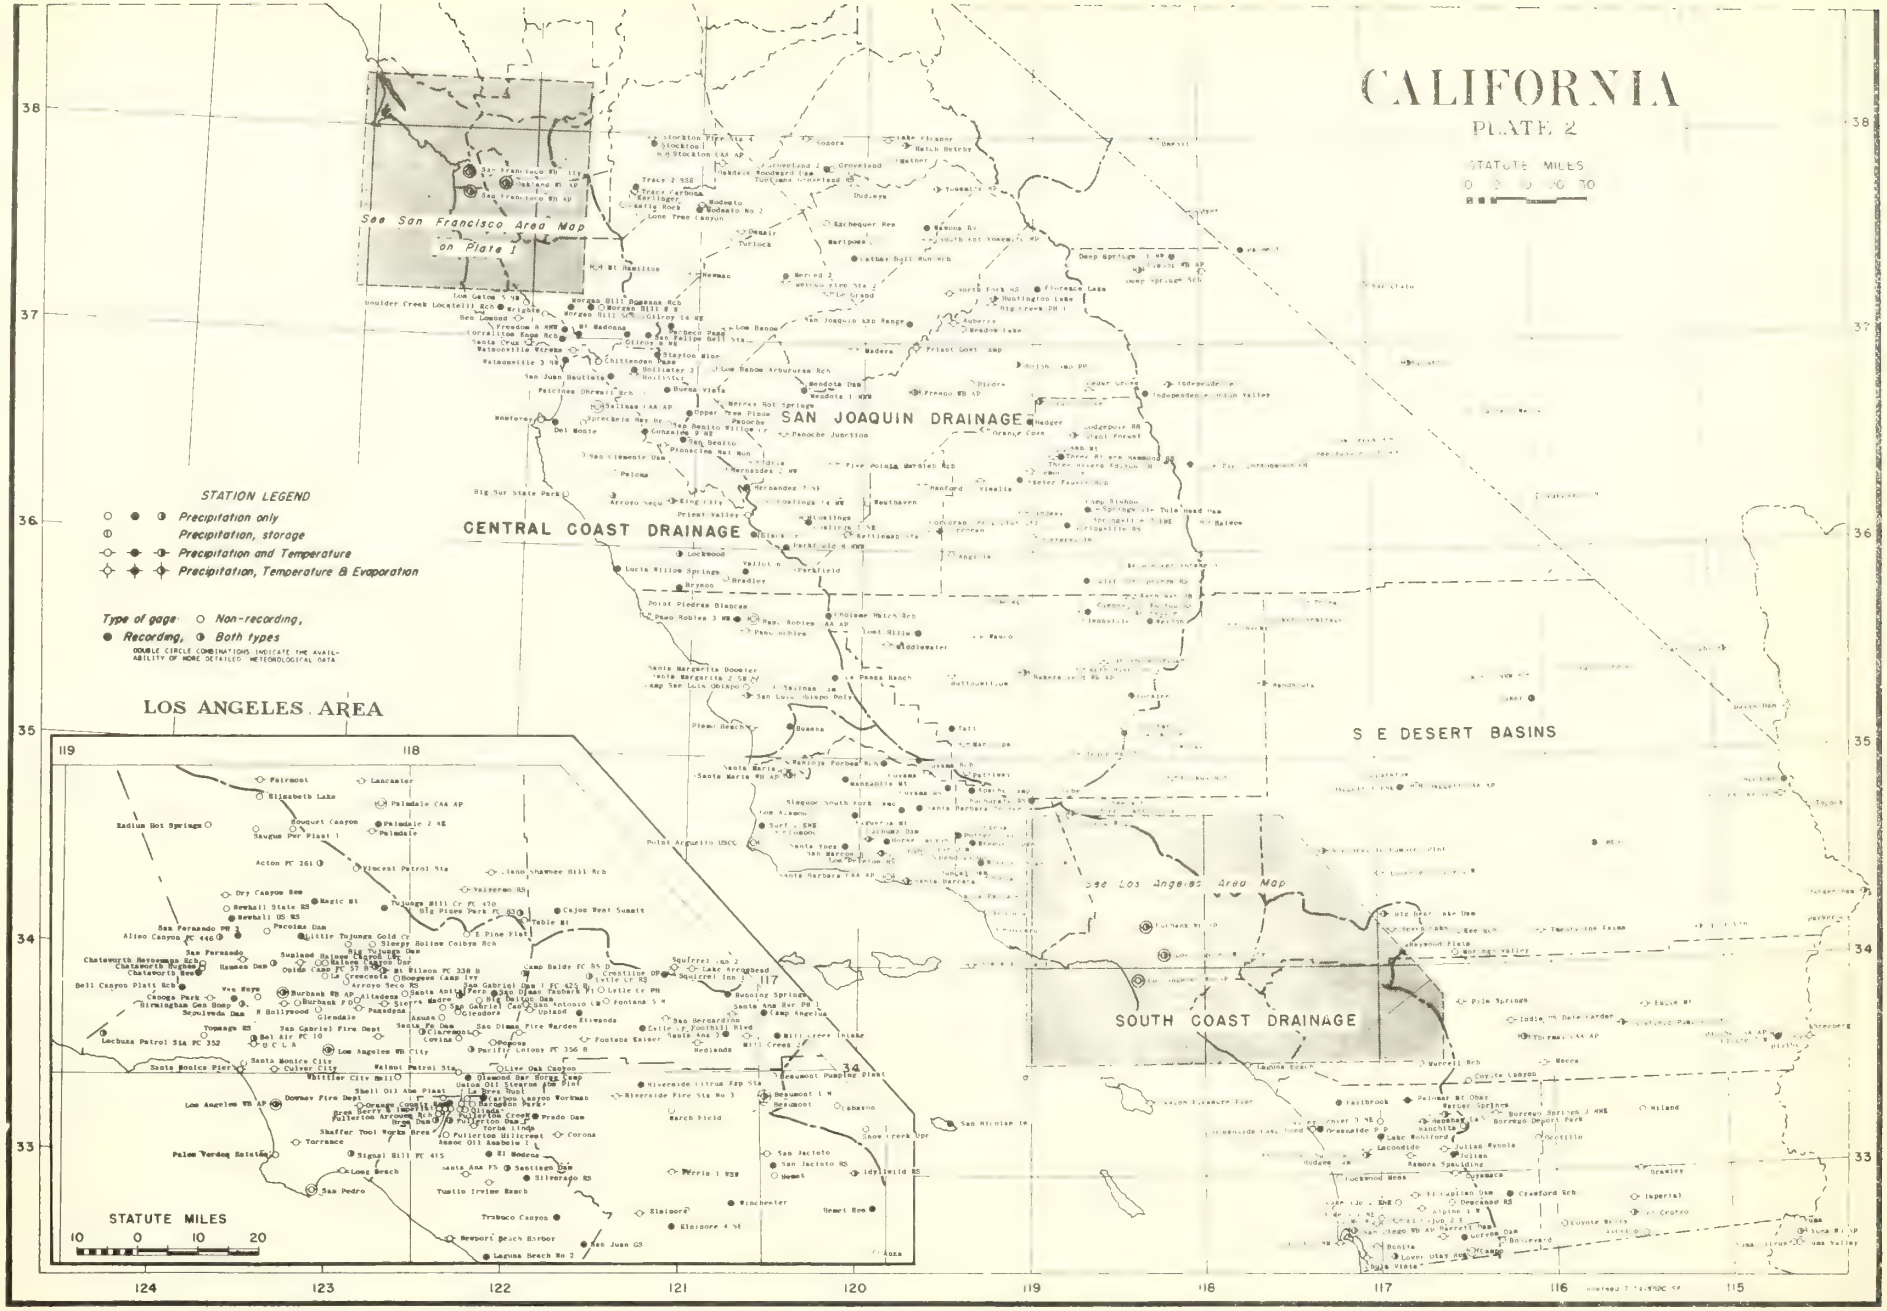
S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

\+ Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.



Additional information regarding the climate of California may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, 557 Federal Building, 50 Fulton Street, San Francisco 2, California.

Subscription Price. 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the Annual Summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to the Superintendent of Documents, Government Printing Office, Washington 25, D.C.

CORRECTED DATA WILL BE FOUND ON PAGE 359.

ANNUAL SUMMARY 1955

Volume LIX No. 13

ASHEVILLE: 1956

WEATHER SUMMARY

GENERAL: By far the outstanding 1955 weather occurrence in California was the series of heavy flood-producing rains of December in northern and central areas. Well over half the 1955 yearly precipitation fell during December at most stations in the northern half of the State. It was by quite a margin the wettest December on record over most of northern California, and all major streams flooded at record or near-record levels. The year otherwise was cool and dry, and there was persistent dryness in Southeast Desert Basins and South Coast Drainage. The first seven months averaged very cool for the season almost everywhere, then the last five months were mostly quite a bit warmer than usual. Aside from December's serious rains and floods, there were only a few destructive storms during the year. Agriculture as a whole did quite well in spite of some local early season freeze losses, dry ranges and slow dry land crops, and local storm damage.

TEMPERATURES: The average temperature for the statewide area for the year was 58.2°, 1.0° below normal. But this figure is only a very rough approximation, and individual station averages ranged from 36.1° at Twin Lakes upward to 76.8° at Cow Creek. All seven divisions, however, averaged cooler than normal for the year, following a general pattern of cooler than normal through July, then warmer than normal for the balance of the year. Coldest observed within State boundaries during 1955 was the -25° reading at Boca on February 28, while the hottest was Greenland Ranch's 123° on June 7. April was very cool for the season, averaging well below normal temperature in all areas and 4.5° below normal across the State. It was one of the coldest April's of record and the State maximum during the month (96° at Indio U. S. Date Garden) equaled the record for lowest April maximum set in 1942. Most stations averaged cooler than normal for the year, as the average -1.0° deficiency for California as a whole would indicate. The largest deficiency was at Hat Creek PH where the 1955 average 48.4° was 3.7° short of normal. On the other end of the scale was the +2.1° departure at Escondido Church Ranch (1955 average 63.3°).

PRECIPITATION: The State 1955 precipitation average was 22.74 inches, 0.38 inch above normal, but this generalization obscures some salient features, by station, season, and division. It was drier than the usual year in North Coast Drainage and the two southern divisions, while the other four divisions came out of the year with sizeable excesses (headed by Northeast Interior Basins +7.34 inches from a 1955 25.82-inch average total). The largest single station deficiencies were in the South Coast Drainage in the general area east and northeast of Los Angeles. The total of 24.94 inches at Hoegees Camp Ivy was 16.56 inches short of normal, and Camp Baldy FC 85 F was 16.08 inches below normal. On the wet side was Blue Canyon, where the yearly total of 84.17 inches was 30.66 inches more than the long-term mean. The highest station 1955 total was 97.82 inches at Strawberry Valley. Both by totals and by percentages of normal the driest stations were in the Southeast Desert Basins. Cow Creek had the smallest California total for 1955, 0.53 inch, 1.64 inches below and 25 percent of normal. However, the lowest percentage of normal was 18 at Inyokern Armitage (total 0.76 inch, 3.37 inches below normal). Snowfall in mountain areas was fairly heavy, especially late in the year. Aided by snowfall near 150 inches in December, Soda Springs and Twin Lakes had totals for 1955 of 435.0 and 502.0 inches, respectively.

The phenomenal rains (snows at higher levels) that covered most of northern and central California the last half of December not only produced the wettest State December average of record by quite a margin, but accomplished this in spite of a very dry December in the two southern divisions. Several December totals at wetter points exceeded 40 inches, and Strawberry Valley in Yuba County had a total of 54.08 inches for the month, well over half the annual total. 17.00 inches of that December total fell during the December 22 - 23 period when flooding became most severe. The Blue Canyon December total of 45.12 inches was a staggering 36.37 inches above normal, but departures greater than +30 inches were noted at several places. By any standard of comparison these late December rains in Northern California were unprecedented, not only for several points which had their wettest Decembers of record, but also from the standpoint of the excessive flooding, which occurred on nearly all streams in the northern half of the State.

DESTRUCTIVE STORMS: By far the most serious and destructive weather during 1955 in California centered around the severe winds, rains, and floods of the December 18 - 26 period. The severity and persistence of the rains were mentioned briefly above, but the reader is referred to the December 1955 "Climatological Data for California" for more detailed information, including many measurements from unofficial gages not usually published. One unofficial storm total which reflected the excessive nature of rainfall was 43.19 inches at Los Gatos 5 MI W (McKensie) during the December 16 - 27 period. Other publications carrying details on the floods accompanying the heavy rains are: "Preliminary Report on Floods of December 1955 in Central and Northern California and Western Nevada", prepared under the direction of William F. Cassidy, Colonel, Corps of Engineers, South Pacific Division, San Francisco, and "California Floods of December 1955" published by the State of California Department of Public Works, Division of Water Resources. In many localities the floods were the worst of record. An American Red Cross preliminary survey reported flood losses including 66 persons killed, 3,763 injured, 1,316 dwellings destroyed, and over 16,000 homes damaged to a reportable degree. The American Red Cross final report will be published about April 1, 1956, and a complete U. S. Geological Survey report will follow later. While final figures would not be reached until later in 1956, it seemed likely that the monetary loss from the floods would exceed $100 million. The American Red Cross assistance cost exceeded $8 million, and highways and roads alone were estimated by the Assistant State Highway Engineer to have suffered damage of more than $30 million. Early in this storm period, high winds aggravated by continuous rains caused $2,750,000 in damage in northern and central California. This phase of the storm, quite serious in itself, faded almost into insignificance in comparison with the flood disaster which followed.

During the rest of the year the severe storms that occurred were mostly small scale. Wind and hail damage was reported at least once each month from local areas, but the worst wind of the year was that in December in northern and central parts of the State. On April 1 - 2 strong winds and dry soils combined to produce a number of duststorms and considerable property damage across large parts of the south half of the State. Hailstorms and flash floods from heavy rain showers caused noteworthy damage on a few occasions June through August. In the Lake City area in Modoc County a "cloudburst" on June 15 caused $100,000 in damage from slides, washouts, and crops lost. On July 18 heavy thunderstorms in Imperial County caused various types of crop and property damage, and then on July 21 - 22 northwest of Leevining, in Mono County, very heavy showers caused landslides burying highways up to 50 feet deep with mud and debris, destroying cabins and several automobiles. Another scattering of flash floods struck the southern part of the Southeast Desert Basins on August 17, causing some highway and railroad washouts.

AGRICULTURE: The weather during 1955 was generally favorable for agriculture, but not without locally important exceptions. For the greater part of the year precipitation was deficient, and only the December excesses brought 1955 totals for most stations to above normal. During the first three months there was considerable freeze damage in northern sections, and crops were generally slow until the cold spring season ended. Damage from hail, flash flooding, and lightning fires was not unusual, but it was troublesome in some localities. Wind blew down nearly ripened fruit in some sections, and blowing dust was annoying, even damaging, at times during the dry periods. Damage to crops from too much heat occurred in southern areas in August and September. Livestock and soil erosion losses occurred in the December floods, but actual crop losses were very small compared with the other flood damages. While northern California ended the year with more than enough moisture, dryness in southern California had become something of a problem, and range grasses and grains were in need of rain.

Livestock closed the year in good condition; and irrigated pastures in southern counties were in better condition than usual.

R. A. Dightman

REFERENCE NOTES

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles.

Evaporation is measured in standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 4.

The four-digit identification numbers in the Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Delayed data and corrections will be carried in the June and December issues of Climatological Data.

No record

\+ Also later date (dates) or months

* Amount included in following measurement

\# Thermometers are generally exposed in a shelter located a few feet above sod-covered ground, however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building

// Gage is equipped with a windshield

b Adjusted to full month.

C Data for recorder stations denoted by "C" are processed for special purposes and published in "Hourly Precipitation Data". Length of record for recorder-only stations may be found in the annual issue of "Hourly Precipitation Data".

E Amount is wholly or partially estimated.

M Less than a complete month of record available; if average value is entered, less than 10 days of record are missing. See monthly Climatological Data for detailed daily record.

R Data from recording gage.

T Trace, an amount too small to measure.

V Includes total for previous months. V in annual column means total is for a two-year period.

S Storage precipitation station. Data will be published in the July or August or delayed data December issue of Climatological Data.

Additional information regarding the climate of California may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, 557 Federal Building, 50 Fulton Street, San Francisco 2, California.

Subscription Price: 20 cents per copy, monthly and annual; $2.50 per year. (Yearly subscription includes the annual summary.) Checks and money orders should be made payable to the Superintendent of Documents. Remittances and correspondence regarding subscriptions should be sent to Superintendent of Documents, Government Printing Office, Washington 25, D. C.

JANUARY 1956
Volume LX No. 1

ASHEVILLE: 1956

WEATHER SUMMARY

For the second consecutive month heavy precipitation fell in central and northern California throughout most of January and fell with a vengeance in southern California near the end of the month. The intensity was strong at times in the northern portion, but even though the monthly totals were almost as high as December, the rainy periods were spread over a longer period of time. The ground was pretty well saturated from the intense December storms, however flood damage was not so widespread this time. The storm at the end of the month was accompanied by high winds striking both northern and southern California and reaching gusts of 70 m.p.h. at Blue Canyon and 37 m.p.h. in the Los Angeles area. A more detailed report covering the flooding and wind damage prepared by the State Climatologist in San Francisco will be found at the end of this summary.

Temperaturewise, January was the fifth month in the past six where temperatures were warmer than usual for the State. Good examples of this trend were found in the desert regions of southern California where Twentynine Palms was 6.7° above its long-term mean and Backus Ranch 6.0° above. Bridgeport Dam and Lake City in northern California were above 8.5° and 6.1°, respectively. On a day-to-day basis, most of the State was warmer all month with the exception of the last few days when the storms ended and clearing weather set in resulting in lower minimum temperatures. The only notable cooling during January was along the southern California coast between Oxnard and Laguna Beach and in a fairly large section in the Sierra Nevada Mountains just west of Lake Tahoe. Indio U. S. Date Gardens recorded the highest monthly mean of 58.3° and White Mountain 2 had the lowest mean of 14.5°. Yorba Linda and Thermal CAA AP both were the hot spots in the State recording a maximum of 85°, the former on the 3d and the latter on the 11th. Boca had the lowest minimum of -22° on the 30th. Mt. Shasta reported its mildest nighttime temperatures in history between the 1st and 27th.

Precipitation fell over northern California nearly every day between the 1st and 27th except for a brief respite on the 15th and 16th and again beginning on the 28th. Blue Canyon, Eureka, Red Bluff, and Mt. Shasta had measureable precipitation on 20 days or more with Eureka having it on 25 days. Central California had between 10 and 17 such days and southern California around 7. By combining the total rainfall of both December 1955 and January 1956, it is possible to make a few interesting observations. At Sacramento, the precipitation for December (12.20 inches) and January (7.58 inches) totalled 19.78 inches for the greatest consecutive two-month total since December 1861-January 1862 when 23.68 inches were recorded. At San Francisco the 18 days of measureable rain in January added to the 22 days in December made it the rainiest two-month period since 1916, when there were 41 days of measureable rain during January-February. Oakland's total rainfall of December 1955-January 1956, of 18.89 inches actually exceeded its seasonal normal by 1.26 inches. The heavy rains in southern California dumped 6.11 inches on Los Angeles in 24 hours on the 25th and 26th, the third greatest of record. In the seven month period ending with January, many stations had already received more precipitation than they would in a normal year: Blue Canyon with 78.57 inches had 25.06 inches more, San Francisco had 2.13 more, Sacramento 6.14 more, and Fresno 1.17 more. The greatest monthly total was 32.75 inches at Pit River PH 5 and the greatest 24-hourly total was 10.15 inches at Fontana 5 N on the 26th. By contrast, it might be mentioned that there were actually four stations where no precipitation occurred -- Greenland Ranch, Mecca, Niland,and Parker Reservoir. Snowfall was generally heavy in higher elevations during the month. Mt. Shasta reported that on January 30, the U. S. Forest Service measured 123 inches of snow, water content 48 inches, at 7,000 feet and 161 inches, water content 65 inches, at 8,000 feet. Other snow depth measurements show Soda Springs had 105 inches and Twin Lakes 121 by month's end.

Many areas had their cloudiest January in years. San Francisco had only 28 percent of the possible sunshine, the least since January 1916, when sunshine was only 21 percent of possible. Santa Maria had 15 days of heavy fog compared to a January average of five.

The following crop and farm reports were reported by the State Climatologist in San Francisco: In the central and northern coastal districts rains kept fields muddy and stopped or hindered all farm work. In Lake County, range grasses, pastures, and cereals planted before the rains, were reported doing well, but it was feared that the planting dates of late winter and early spring cereal and hay crops may be delayed and result in lighter crops. Some orchards in Santa Cruz County still had standing water in them since the December 23d flood which will probably cause some loss in orchards. In Monterey County the continuous rains and standing water caused considerable damage in some of the artichoke and spring cole crop fields. Farm work was delayed in the lower San Joaquin Valley and early almonds were starting to bloom in Stanislaus County. Mild temperatures and rains were favorable to ranges and growing crops in Tuolumne and Madera Counties. In the upper San Joaquin Valley farm work and clean-up cotton harvesting were hindered by the recent rains, but vegetation was generally near or ahead of average. Heavy rains in the Los Angeles area brought all farm operations to a standstill and caused some erosion and inundation damages, but the benefits resulting from the heavy rain in ending the drought more than offset the losses. The rain fell slowly during the first 12 to 15 hours of the storm and, during that period, was readily absorbed by the very dry soil. The heavy downpours that followed produced considerable runoff, and larger reservoirs impounded thousands of acre feet of much needed water. In the San Diego area the valuable moisture was of untold benefit in saving the grain crop which had several inches of growth, in giving pasturelands new life and growth, and in encouraging additional planting of grains and vegetables. Fields were too muddy to work, however, and the rains hindered picking of avocadoes and oranges.

Joseph R. Glantz

SEVERE STORMS FOR JANUARY 1956

Heavy precipitation continued in north and central California in January and, with the ground still saturated from the December deluges and record-breaking floods, there were several periods of river rise and additional flooding. On January 7th a cold front that had been almost stationary across the extreme northern portion of California intensified and moved southeastward across the State causing heavy precipitation in several areas and heavy snowfalls in the Sierra which closed major highways on the 7th. In Sacramento .25 inch of rain fell in less than five minutes, and at Sly Park Dam in the upper Consumnes Basin .74 inch fell in about 15 minutes; at San Francisco .26 inch fell in 15 minutes on the 7th. A river height of 30 feet, a foot above flood stage, was observed at Guerneville the morning of the 8th.

The Meteorologist in Charge of the San Francisco River District reported, "A series of storms, ominously resembling those of the December flood period, which had developed to the north of the Hawaiian Islands, began moving toward the west coast on the 13th. Heavy rains ensued, beginning on the evening of the 13th and continuing through the afternoon of the 15th. A crest slightly above the flood stage was observed at Hopland on the evening of the 15th, and a crest about five and a half feet above the flood stage was observed at Guerneville on the early morning of the 16th. Damage was light and consisted primarily of local lowland flooding in the upper reaches of the river and resort area flooding around Guerneville of the type usually experienced in normal winter floods. During this same storm period heavy rains in the San Francisco Bay area produced local flooding in many communities. Low-lying areas in Marin County were hardest hit, particularly Tamalpais Valley where hundreds were evacuated over the two-day period as high tides and storm runoff produced floods; and Bolinas, on the coast, where serious landslides resulted. San Francisco City recorded 4.70 inches of rain during the storm period - more than for any comparable time during the December storms." Mud slides also caused considerable damage in several areas of new construction in peninsula cities south of San Francisco. Heavy rains along the north coast on the 14th and 15th resulted in some flooding on the Eel River, Smith River, and Redwood Creek on the 15th; considerable damage was reported to previously weakened highways and railroads with damage amounting to several thousand dollars. The Feather and Yuba Rivers crested at slightly above 68 feet at Yuba City the morning of the 16th. Corps of Engineers, U. S. Army, threw a wall of canvas, about 4000 feet long, on the newly rebuilt levee near Shanghai Bend on the 15th to protect the soft river side from the chopping waves, and the levee withstood the severe test. Repair of the Feather River levee break at Nicolaus was not completed, however, and the flood waters rushed through a 200-foot breach destroying much of the work which had been completed on the 4200-foot levee break. The waters rose to two to four feet deep in the streets of Nicolaus on the 17th, flooding out many who had completed cleaning out their homes and had moved back after the December flood. Water still remained in much of Reclamation District 1001 from the December floods, however, and houses and ranch buildings in that 30,000 acre district were under as much as 20 to 25 feet of water approximately six weeks.

A storm moved eastward across central California on the 25th causing rain and high winds over northern and central California, ranging from gusts of 50 to 60 m.p.h. in the Merced-Sacramento area to 30 to 40 m.p.h. along the central California coast. Small waves on the trailing storm front caused continuous heavy rain in southern California on the

26th, and another storm front moving across the State on the 26th and 27th caused heavy precipitation in central and southern California, and strong winds on the coast and many places over the interior; winds reached gusts of 70 m.p.h. at Blue Canyon, 58 at Arcata, 60 at Sacramento Airport, and 37 at Los Angeles Airport. A slide on the 24th at Kekawaka, 50 miles south of Scotia, covered a 375-foot section of the Northwestern Pacific Railroad track, wiping out any chance that the company might have been able to reopen its battered line by February 1 as hoped. High winds on the 25th uprooted trees which caused several power failures in the Grass Valley area, and a falling tree crushed the top of a parked car in Walnut Creek. The Sacramento River reached about a foot above the danger level at Rio Vista, flooding Vierra's Resort on the 25th and causing considerable apprehension in the Sacramento-San Joaquin Delta area. The flood was intensified by unusually high tides which flooded some lowland area in the Delta and Bay area; high water poured over the Napa River levees south of Napa on the 25th to 27th; at Alvarado the same levee which gave way on December 24 burst again flooding several hundred acres of farm land which had not had a chance to dry after the December floods, and several farm buildings; Alviso was flooded by high tides with the water reaching depths of three feet on the Mountain View-Alviso State Route 9 on the 26th. Geological Survey reports showed that streams in the upper Salinas Basin generally exceeded the December 1955 peak stages; Jack Creek near Templeton and the Salinas River at Paso Robles reached their highest stages of record on the 25th, the 16.73 feet recorded at 3:30 p.m. at Paso Robles surpassing the previous record of 16.2 feet on March 9, 1943. Rivers ran bankful but no extensive flooding occurred. Torrential rains occurred with Santa Margarita, in the southern extremity of the Salinas Basin, receiving 7.84 inches during the storm period. Some damage resulted in this area and there were reports of roads flooded, a bridge washout at Atascadero, and lowland farm flooding which necessitated the removal of livestock. In Los Angeles 6.11 inches of rain fell in 24 hours on the 25th and 26th, the third greatest 24-hour rainfall of record. The Meteorologist in Charge of the Los Angeles River District furnished the following summary: "Heaviest rainfall occurred on the morning of the 26th with amounts ranging from .30 to .70 inch per hour for several hours at many locations. At the Los Angeles Civic Center the greatest hourly amount was .85 inch, and at Sawpit Canyon in the Sierra Madre foothills .95 inch was recorded for the greatest hourly amount. Most of the flooding was due to overflow of storm drains and small creek areas on the coastal plain. Very little runoff occurred in foothill and mountain areas due to the soil moisture deficiency resulting from a period of over three weeks with no measureable rain. Major stream channels generally carried from 1/4 to 1/2 of their capacity, but some channel damage occurred due to undercutting at the interface between paved and unsurfaced channel sections. The largest single report of damage was the flooding and resulting fire at the Ford Motor Company plant in Long Beach when a dike broke under the combined influence of flood waters and a high tide. The remainder of the damage was largely due to partial inundation of many homes in low-lying sections, mostly in the communities of El Segundo, Torrance, Gardena, Venice, Lawndale, Wilmington, Playa del Rey, and Manhattan Beach. Some 1,500 people were evacuated from their homes during the height of the storm, but the actual number of homes flooded was only a small fraction of those evacuated. Other damage occurred to streets and highways and to commercial establishments, and some damage was reported in and below hillside subdivisions where dirt washed down from recent cuts and fills. There was only one death directly attributable to the flood. This occurred when a 7-year old boy fell into a storm drain along the Rubio Wash at San Gabriel."

Flooding also occurred in the Fresno River District on the 25th and 26th, and the following report was prepared by the Meteorologist in Charge: "Stream flows were considerably less than during the December floods, and most flooding occurred on agricultural land. The Chowchilla and Fresno Rivers inundated land around Chowchilla and Madera, but heaviest uncontrolled runoff was from the Kaweah and Tule Rivers. Additional damage was sustained by levee systems of these rivers, but most inhabitated areas were saved from flooding by constant repairs to protective systems. Highway 99 to the southeast of Visalia was flooded for a short time temporarily restricting travel. Mill Creek, normally used for irrigation purposes, and running under one of the main streets of Visalia, became blocked and flooded about one-third of the city, causing an unestimated amount of damage to homes and business establishments. In the Visalia area constant work enabled crews to strengthen the water courses and to avert large scale flooding of that city by the Kaweah River."

The general end of the December and January heavy rains and flooding was marked by thunder, hail, and lightning in the Bay area, generally on the evening of the 26th. Lightning strikes caused damage to about a half dozen homes in the northern Bay area counties. The most extensive damage was reported to the Robert G. Heitz home, 3413 El Monte Drive, Concord, and the Nikola Drakulic home, 2040 Clemens Road, Oakland, where major structural damage occurred. There were a number of telephone and power outages in the area, and considerable hail was reported in the Santa Rosa and Sebastopol areas.

REFERENCE NOTES

The four-digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F.

Long-term means from which departures are computed are based on 10 years or more of record ending generally with data for 1950.

Long-term means for full-time stations (those shown in the Station Index as 'U. S. Weather Bureau') are based on the period 1921 - 1950, adjusted to represent observations taken at the present location.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 6:00 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

• Amounts included in following measurement, time distribution unknown.

Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are publisehd later in Hourly Precipitation Data

D Water equivalent of snowfall wholly or partly estimated, using ration of 1 inch water equivalent to every 10 inches of new snowfall.

G In the "Refer to Tables" column in the Station Index the letter "G" indicates Daily Soil Temperatures are published.

M One of more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December ussue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

Additional information regarding the climate of California may be obtained by writing to any Weather Bureau Office or to the State Climatologist at Weather Bureau Office, 557 Federal Office Building, 50 Fulton Street, San Francisco 2, California.

CALIFORNIA

FEBRUARY 1956
Volume LX No. 2

ASHEVILLE: 1956

WEATHER SUMMARY

Heavy rains continued to plague the northern and north-central portions of California again this month while the remainder of the State received below average precipitation. In a separate text at the end of this summary will be found an account of flood damage and wind damage as prepared at the State Climatologist's office at San Francisco. Except for a few showery periods from the 4th to the 7th and again from the 11th to the 15th, most of the State was under the influence of a rather stationary high pressure area lying off the Pacific Coast. This High maintained a northerly flow of cold air over the State and resulted in generally clear weather and below February average temperatures up to the 17th. A storm moving southeastward in the North Pacific from the Gulf of Alaska to off the British Columbia coast caused moderate rains on the 19th and 20th from the Bay Area northward, and warming temperatures over the State. High winds accompanied this storm in northern California causing near record-breaking winds to blow at Red Bluff on the 21st.

Temperatures over the State were lower than usual with the majority of the stations in the northern part showing anomalies of from -2° to -8° and in the southern part of from -1° to -6°. Bakersfield had its fourth coldest February since 1900. Fresno recorded minimum temperatures of 32° or lower on 13 days. This was 11 more than normal and duplicated the record set in February 1955. The average monthly and average minimum temperatures at Fresno were the lowest ever recorded in February. Santa Maria also had its lowest average minimum and monthly temperatures in 14 years. Sandberg's minimum of 16° on the 16th was its lowest February temperature in 23 years. The lowest temperature in the State was the -29° recorded at Boca on the 2d, and the lowest mean temperature was 8.8° at White Mountain 2. Some warming occurred in northern California between the 5th and 12th and again around the 20th and 22d. In southern California slight warming occurred mainly during the first half of February. The highest temperature, 80°, was reported by eight stations in the Southeast Desert Basins after the 12th. Cow Creek had the highest mean monthly temperature, 56.9°.

Except for a few showers in the northern portion, most of the State received little or no precipitation during the first 17 days of the month. This lack of precipitation seemed so unusual after the two previous wet months that Sacramento made mention of the fact that it had no rainfall for 18 straight days and San Francisco had none for 20. However, moderate to heavy rain struck northern California on the 19th, spreading into the San Joaquin Valley and thence into the coastal regions of southern California on the 23d and 24th. Gasquet Ranger Station received the greatest catch during this period, 8.50 inches, and also had the greatest monthly total 24.29 inches. The storm totals from the 19th to 23d were not as great as those of a similar period in December 1955, however considerable precipitation was received, causing more flooding. Some totals for that five-day period were: Mineral 11.67 inches, Greenville 12.44, Brush Creek 12.55, and Middletown 14.99. In the eight month period ending with February, Mt. Shasta had already recorded 46.24 inches compared to the normal year of 33.89 inches. Blue Canyon's total for the same period of 88.33 inches compared to its normal year's fall of 53.87 inches. Most stations in the North Coast Drainage reported a fall of 100 to over 200 percent of their long-term means with Burney reporting 264 percent. Further south in the State, precipitation totals were below long-term means. The San Joaquin Valley received only 20 to 60 percent and southern California coastal areas remained relatively dry receiving about 20 percent. The desert region continued to be very dry as 13 stations recorded no precipitation all month.

The snowpack in the mountains was greatly increased following the storms after the 18th. Norden's increased from 100 inches on the 19th to 188 inches on the 26th. Mt. Shasta mentioned that a snow survey on the west slope of Mt. Shasta at the close of the month reported 172 inches on the ground at 6760 feet and 236 inches at 7500 feet. By month's end Squaw Valley had a snow depth of 96 inches, Twin Lakes 126 inches, and Soda Springs 142 inches.

Santa Ana winds struck portions of southern California on the 2d and again on the 8th causing considerable dust and some damage was reported. Ontario Airport had winds with gusts above 90 m.p.h. on the 2d. High winds were also reported from the 19th to 22d in central and northern California with Hamilton Field reporting gusts to 51 m.p.h. on the 19th. Other windy spots on that day were: San Francisco Airport with gusts to 45 m.p.h., Salinas 37, Sacramento 36, and Red Bluff 56. From the 18th to 22d Red Bluff had an average wind speed of 36.6 m.p.h. during an 80-hour period. On the 21st they reported a 61 m.p.h. wind wi gusts to 70 m.p.h., establishing a new February record. was also the second highest speed ever recorded there.

Strong winds in the upper Sacramento Valley during t month hindered spraying and blew down a few oak trees, b there were no reports of orchard tree damage. Winds on t 16th plus blowing sand in the Imperial Valley caused lig and scattered damage to flax and melons. Freezing and ne freezing temperatures during the first half of February we a hazard to orchards and asparagus in the delta areas of t Sacramento Valley. Low temperatures hurt almonds in t budding stage and retarded vegetative growth in the San Jo quin Valley. These also damaged about 600 to 700 acres potatoes in Kern County. Cold nights did considerable dar age as well to small artichokes in the Santa Maria area a damaged most of the early strawberry blooms and avocac blooms in the San Diego area. Imperial Valley suffere freeze damage to tomatoes when winds blew the caps from t plants and left them unprotected. However, cantaloupes wer recovering from the cool weather. The late rainy periods i the Sacramento and San Joaquin Valleys were unfavorable t most agricultural activities and in many localities at month end, fields continued to be too wet to be worked. More rai was needed in Los Angeles County for grains, and pasture were producing only limited feed in some areas. Some irri gating had already begun in the orchards. The San Dieg area also needed more rainfall, but prospects were favorabl for early and abundant vegetable crops.

Joseph R. Glantz

WINDSTORMS OF FEBRUARY 2 AND FEBRUARY 8

High pressure over the Rocky Mountains resulted in Sant Ana winds which caused considerable dust and damage ove portions of southern California on the 2d and again on th 8th. At Ontario Airport winds were reported to have reache gusts above 90 m.p.h. on the 2d, and only the disk of the su could be seen through the blowing sand and dust. Air traf-fic was halted and some road travel severely hampered b the poor visibility and drifting sand. Roofs of airport warehouses at Ontario were damaged, and some trees and pow-erlines were downed in the Cucamonga-Ontario-Upland area.

Winds on the 8th lifted and smashed a 60 x 24 foot build-ing at San Bernardino and blew down a number of trees and powerlines in Redlands and Orange County; Trabuco was with-out power overnight.

High winds in the Pasadena area on the 16th blew down some trees which caused reported damage to two autos and a house in Pasadena.

SEVERE STORM REPORT, FEBRUARY 19 TO 23

A storm moved southeastward in the North Pacific from the Gulf of Alaska to off the British Columbia coast on the 18th, deepening and becoming entrenched off the coast of Washington between the central Pacific High and high pressure over west-ern Canada and Alaska and continuing through the 22d. Heavy rains began in northern and central California early on the 19th as the first of a series of open waves approached north-ern California in the northwesterly flow between the Pacific High and Low. A storm front became established over ex-treme northern California and southwesterly flow was main-tained over the northern part of the State causing heavy rains through the 22d. Dos Rios, in the southern part of the Eel River watershed, recorded over 15 inches in the three days from the 20th to 22d. The heaviest storm rain-fall reported in the Russian River basin was 10.32 inches at Guerneville. Nearly 15 inches fell at Middletown, and at Hobergs 19.32 inches of rain fell from the 19th to 23d. High winds occurred over much of northern and central Cali-fornia on the 19th and 20th. At Red Bluff wind speeds aver-aged 36.6 m.p.h. during an 80-hour period from the 18th to the 22d reaching a record February fastest mile of 61 m.p.h. on the 21st with gusts to 70 m.p.h. The winds damaged roofs and downed telephone lines in some areas of northern Cali-fornia. Rivers rose in the north coastal areas early in the week with the Eel River rising above flood stage from the 21st through the 23d and reaching a crest of 22.7 feet at Fernbridge on the 21st, about five feet above flood stage. This caused additional bank erosion, and considerable valu-able farm and industrial land was lost, especially near the town of Fortuna. Additional damage also occurred to roads, but there were no lives lost in the flood. Only minor flood-ing with no appreciable loss occurred along the Smith River. The Northwestern Pacific Railway tracks were covered by 17 slides between Dos Rios and Scotia, and the high winds blew

WEATHER SUMMARY (Continued)

down telephone and telegraph lines completely isolating Eureka on the 21st. The Russian River exceeded flood stages at Healdsburg and Guerneville with the water reaching a crest of 39.9 feet at Guerneville on the early morning of the 23d which, excepting the record December 1955 stage of 47.6 feet, was the highest mark since February 28, 1940. The Meterologist in Charge of the San Francisco River Forecast District reported: "Along the Russian River flooding occurred from Cloverdale downstream to the Healdsburg-Guerneville resort region. Railroad operations on the Northwestern Pacific were halted in the Geyserville-Cloverdale area due to flooding, and a number of roads in Sonoma County were inundated. There were a number of forced evacuations of families in the Russian River lowlands and considerable precautionary evacuation in the Guerneville area. Extensive damage was reported in the Guerneville area. Streams also ran high in the Napa River basin. Roads and some lowlands were flooded in the Napa Valley. High tides on the evening and morning of the 22d - 23d contributed to local lowland flooding and the consequent evacuation of some families in the Napa area. Local flooding was again experienced in the San Rafael-Kentfield area of Marin County on the 19th and 20th as a result of the heavy rains at the beginning of the storm period." No flooding occurred south of the San Francisco Bay area. There were short periods of very heavy rains in Redding and Anderson with a downpour, reported as 1.22 inches in one and one-half hours, at Redding on the 21st which flooded the streets of that city. Heavy rain in the Chico area on the 22d caused local flooding. These heavy rain periods brought significant rises to the Sacramento River system with the Sacramento River reaching a level above flood stage at Red Bluff, cresting at 23.4 feet on the 22d, only one-tenth of a foot below the January high water level. There was no damage from flooding reported in the Red Bluff area however, except some in small stores located near the river in the vicinity of Vina. A break in the Cache Creek levee near the Yolo bypass on the 22d caused flooding of about 1,000 acres of farm land. Although there was some apprehension in the Yuba City-Nicolaus area, and the Yuba City postponed Christmas activities (February 25) were greatly hindered by the heavy rains and high winds, the repaired levees held and there was no recurrent flooding of these areas.

Heavy snow fell in the Sierras during the storm. The snow depth increased from 90 inches at Soda Springs on the 19th to 144 inches on the 26th, and at Norden from 100 inches on the 19th to 188 on the 26th, double the average depth for that date. This heavy snowfall with high winds closed highways and roads in the Sierras on the 20th.

Robert F. Dale

REFERENCE NOTES

The four-digit identification numbers in the Index number column of the Station Index are assigned on a state basis. There will be no duplication of numbers within a state.

Figures and letters following the station name, such as 12 SSW, indicate distance in miles and direction from the post office.

Observation times given in the Station Index are in local standard time.

Delayed data and corrections will be carried only in the June and December issues of this bulletin.

Monthly and seasonal snowfall and heating degree days for the preceding 12 months will be carried in the June issue of this bulletin.

Stations appearing in the Index, but for which data are not listed in the tables, are either missing or received too late to be included in this issue.

Unless otherwise indicated, dimensional units used in this bulletin are: Temperature in °F., precipitation and evaporation in inches, and wind movement in miles. Degree days are based on a daily average of 65° F.

Long-term means from which departures are computed are based on 10 years or more of record ending generally with data for 1950.

Long-term means for full-time stations (those shown in the Station Index as 'U. S. Weather Bureau') are based on the period 1921 - 1950, adjusted to represent observations taken at the present location.

Evaporation is measured in the standard Weather Bureau type pan of 4-foot diameter unless otherwise shown by footnote following Table 6.

Amounts in Table 3 are from non-recording gage, unless otherwise indicated.

Data in Tables 3, 5, 6 and snowfall in Table 7, when published, are for the 24 hours ending at time of observation. See the Station Index for observation time.

Snow on ground in Table 7 is at observation time for all except Weather Bureau and CAA Stations. For these stations snow on ground values are at 4:30 a.m., PST, except for Bishop WB AP which is 6:00 a.m., PST; Blue Canyon WB AP and Sandberg WB 6:00 a.m., PST. WTR EQUIV in Table 7 means the water equivalent of snow on the ground. It is measured at selected stations when the depth of snow on the ground is two inches or more.

Water equivalent samples, as published in Table 7, are necessarily taken from different points for successive observations; consequently occasional drifting and other causes of local variability in the snowpack result in apparent inconsistencies in the record.

- No record in Tables 3, 6, 7 and the Station Index. No record in Tables 2 and 5 is indicated by no entry.

+ And also on a later date or dates.

* Amounts included in following measurement, time distribution unknown.

\# Thermometers are generally exposed in a shelter located a few feet above sod-covered ground; however, the reference indicates that the thermometers are exposed in a shelter located on the roof of a building.

// Gage is equipped with a windshield.

AM Data based on an observational day ending before noon.

AR This entry in time of observation column in Station Index means after rain.

B Adjusted to a full month.

C In the "Refer to Tables" column in the Station Index the letter "C" indicates recorder stations. These stations are processed for special purposes and are publisehd later in Hourly Precipitation Data.

D Water equivalent of snowfall wholly or partly estimated, using ration of 1 inch water equivalent to every 10 inches of new snowfall.

G In the "Refer to Tables" column in the Station Index the letter "G" indicates Daily Soil Temperatures are published.

M One of more days of record missing; see Table 5 for detailed daily record. Degree Day data, if carried for this station, have been adjusted to represent the value for the full month.

R Amounts from recording gage. (These amounts are essentially accurate but may vary slightly from the amounts to be published later in Hourly Precipitation Data.)

S Storage precipitation station. Precipitation measurements, made at irregular intervals, will be published in the July or August or delayed data December issue of this publication.

SS This entry in time of observation column in Station Index means sunset.

T Trace, an amount too small to measure.

V Includes total for previous month.

VAR This entry in time of observation column in Station Index means variable.

MARCH 1956
Volume LX No. 3

ASHEVILLE: 1956

WEATHER SUMMARY

The presence of a rather stationary high pressure area in the eastern Pacific caused warm, dry, and sunny weather to prevail over most of California throughout the month. This High deflected most of the Pacific storms east-northeastward into Oregon and Washington and at the same time maintained a northerly flow of cold air over California that resulted in lower than usual nighttime temperatures and slightly warmer than usual daytime temperatures. Severe windstorms occurred on the 6th and again on the 12th. The following is an account of some of the wind damage as prepared by the State Climatologist at San Francisco: "A cold front moving southward across southern California on the 6th, coupled with high pressure over the eastern Pacific and a deep Low over the southwestern United States, caused high northerly winds over southern California, resulting in dust- and sandstorms and considerable damage to trees, powerlines, trailers, and homes. The sandstorm forced the closing of U. S. Highway 60 - 70 - 99 from Banning to Indio and disrupted telephone and teletype service between Los Angeles, Palm Springs, and Blythe when a main cable was blown down. At Fontana Kaiser the winds reached 57 m.p.h. on the 6th and 73 m.p.h. early on the 7th. More than 40 trees were reported uprooted in Los Angeles and several streets in Riverside were blocked by fallen trees. Snow fell above 4000 feet closing U. S. Highway 99 between Lebec and Castaic from 3:10 a.m. to 8:45 a.m. on the 6th. On the 12th a Low over Arizona with high pressure over the eastern Pacific Ocean and the Rocky Mountains again caused high winds over southern California. Winds reached 87 m.p.h. at Fontana Kaiser on the 12th. Two house-trailers and cars were blown off U. S. Highway 60 - 70 between Blythe and Indio, killing one of the drivers. Probably the greatest wind damage occurred before dawn on the 12th in the Verdugo Valley-Tujunga area where winds with gusts estimated above 80 m.p.h. destroyed two residences and contributed to the burning of three others (in Tujunga's Manzanita Slopes development) and about 80 acres of brush. The high winds made fire fighting extremely difficult and all of the fire fighting equipment and personnel from the Glendale-Burbank sector was required to bring the blaze under control. The roofs of several buildings were damaged severely and there was widespread minor damage." During the windstorm of the 6th Sandberg recorded winds up to 60 m.p.h., and Los Angeles Airport had a peak gust of 51 m.p.h. On the 12th Burbank had winds with a gust of 56 m.p.h. at 1:10 a.m.

The lowest temperatures of the month generally occurred on the 6th and 7th followed by a warming trend from the 16th to the 30th and the passage of a cold weather front again lowered temperatures from 4° to 13° below average on the 31st. Blue Canyon had its record lowest March minimum temperature, 9°, on the 6th and Sandberg recorded a minimum of 19° on the same date, equalling its all-time March minimum temperature. The coldest spot in the State was White Mountain 2 where both the lowest mean temperature, 18.4°, and the lowest minimum of -32° on the 6th were reported. Cow Creek had the highest mean temperature, 69.3°, and was the hottest spot in the State with a maximum of 100° on the 24th, this being the first time that a maximum of 100° had ever been recorded there in March.

In direct contrast to the very wet months of December, January, and February, March was very dry in northern California. Southern California was also very dry, but this merely maintained the dry spell begun in February. Only a small section in the northwestern corner of the State received precipitation of any consequence, and even here only about 70 percent of usual expectancy fell. A station in this area, Gasquet Ranger Station, reported the greatest monthly fall, 8.63 inches, and Squaw Valley Lodge had the greatest 24-hour catch of 3.55 inches on the 5th. The predominating factor in the precipitation picture over the State was the scarcity. Of the 576 stations sending in reports for March, 203 or 35 percent of them received none whatsoever. Some Weather Bureau stations broke or nearly broke many of their March precipitation records. It was only the second March since 1900 that Bakersfield received no measurable precipitation; Blue Canyon received its lowest total since 1926; Burbank had its driest March since 1934; it was Los Angeles Airport's driest in history; Mt. Shasta's driest since 1926 and fourth driest since 1888; it was Red Bluff's driest since 1885; and this marks the first March since 1900 that Santa Maria had no measurable precipitation. More striking examples include: Sacramento had its driest March and San Francisco its third driest March both since 1850, a period of 107 years. From July 1, 1955 to March 31, 1956, San Diego's total of 2.86 inches was the least amount of precipitation for this seasonal period ever recorded in well over 100 years. The snowpack in the higher elevations was also showing the effects of the lack of snowfall. At Norden the snowpack loss of 72 inches from the 1st through the 31st was the third greatest since records of this sort were begun in 1898. For this same period the depth of snow decreased at Soda Springs 70 inches, from 140 inches to 70. From the 6th through the 31st the snow depth decreased at Squaw Valley from 99 inches to 54 and at Twin Lakes from 124 to 88. A snow survey on the west slope of Mt. Shasta on the 26th showed 143 inches of snow on the ground with 37 percent water content at 6760 feet and 177 inches with a 40 percent water content at 7500 feet.

Much of the State recorded more sunshine than usual. Eureka, normally quite cloudy in March, had 58 percent possible sunshine; San Francisco 79 percent, 15 percent above average; San Diego 76 percent; Los Angeles 86 percent; Red Bluff 88 percent; Sacramento 89 percent; and Fresno 95 percent.

Despite the heavy rains during the early winter months, the prolonged dry spell in March caused some concern for the spring planted grains and pasturelands in the north and central coastal valleys and upper Sacramento valleys. Ample subsoil moisture was present, but the top several inches were critically dry causing the formation of a hard dry crust. Ranges were turning brown to such an extent in the upper San Joaquin Valley and Kings County areas that it appeared that they were beyond the stage where rain would do any good. The lack of rain was becoming critical in pastures and grain fields in the Los Angeles area since water reservoir storage was inadequate for summer irrigation needs. The long dry spell in San Diego County caused ranges to deteriorate, early grain plantings to fail, and prevented late plantings from making good growth. Freezing weather from the 5th to the 8th made it necessary to smudge almond orchards east of the river in the upper Sacramento Valley and there was considerable frost damage to blossoms in almond orchards not protected by heating. In Fresno County extensive frost damage was reported on the 6th, 7th, and 8th, causing additional bud drop on almonds, damage to early plantings of winter grains in Tulare County, and some damage to tomato plants under hot-caps, but no damage to stone fruits was reported. Little frost occurred in the southern California coastal valleys, but Imperial County reported that frost slightly injured tomatoes, melons, and alfalfa during the middle of the month. More damage occurred during the week ending on the 26th to new growth on grapefruit and to several hundred acres of barley and flax. However, most of the flax was expected to recover and the barley was to be cut for hay. Windy conditions in this area during the early part of the month also caused some leaf burn on the melons. On the more cheerful side, the fair weather permitted unlimited field activity throughout most of northern California and was favorable for pollination of orchards coming into bloom. Peaches were also in bloom and early variety walnuts were starting to bloom. Over the remainder of the State the warm dry weather was beneficial to irrigated crops and caused full blooms on much of the deciduous fruit. This same type of weather in Imperial County was good for cantaloupes, alfalfa, flax, and sugar beets, and since the soil temperature was about 60°, more growers were planting cotton.

Joseph R. Glantz
